

**IMS is an IT company, working in Egypt since 2007. IMS is involved in cloud computing for manufacturing applications.**

Our vision for the future is to become a global provider of web based ERP systems to small and medium industries. Our systems will promote best practice methods and be available at affordable prices to the manufacturers. To work with industrial chambers and federations all over the world to introduce to industry members the benefits involved in applying systems that will promote efficiency, increase profit, increase labour wages and reduce waste. That will have an overall positive impact on the whole community where this business is located and allows the business to compete on a global level.

IMS produced a web based ERP especially for garment factories. The reason for choosing the Garment industry is because it is wide spread and found in great numbers world wide. It is one of the most complicated industries in the world. This industry by nature is globalized, with designers in New York, buyers in Hong Kong, manufacturers in Malaysia, shipping products to giant retailers all over the world. A garment factory will have a minimum of four production lines, each line will be running a different style, and each style will have six colours and a minimum of three sizes. All that will change in 7 to 10 days if the factory is lucky. From an operational point of view this is a nightmare.

The system allows users to access a vast amount of information and allows managers to control operations at all levels. It provides accurate costing, planning orders on production lines, dynamic warehousing, organize data related to samples, monitor production at all stages( raw material consumption- order status – finished items – etc), generate hundreds of reports, feature modules for Time & Motion Study that gives machine layout for each production line, Production tracking system setup to work with barcode, Human Resources modules that will insure fair dealings to production workers and accounting module that ties everything together allowing complete control and follow up of operations in real time.

The system also allows the manufacturer to create accounts for their buyers so they can access their orders and check status or make new orders. This makes the work of the buyer much easier to follow on line at any time as well as improve the buyer/manufacturer working relation.

The software already operates in 4 languages, English, Arabic, French and Spanish. Currently IMS is working on adding more languages like Hindi, Chinese, Vietnamese, Portuguese and Turkish.

What sets IMS apart from other ERP systems is its specialization in specific industries. Currently development is underway in the following sectors;

- |                            |                     |
|----------------------------|---------------------|
| 1- Furniture Manufacturing | 2- Plastic Forming  |
| 3- Electronic Assembly     | 4- leather Products |

The fact that we have completed the garment industry software, which we considered to be the most complicated, will allow us to complete the other products with great ease.

IMS has come to realize that to reach its goals with the current resources will take many years. This is why IMS is looking for a partnership with a larger company. The small size of our company does not match the large size of the software we have produced. The ideal partner will be an IT company with a strong infrastructure that can launch a first of its kind product globally.
